

Incident Report

Alert Title: Brute Force Detection

Alert Time: 24 hours and Last 7 days

Priority: High

Rule ID: 92058

Rule Level: 12

Verdict: True Positive

Summary

The Wazuh SIEM generated a **high-severity alert** after detecting multiple failed **sshd-session[3503]** attempts originating from the **same source IP** address within a **60-second** time window. The alert was triggered by a custom correlation rule that identifies five consecutive failed SSH login attempts from a single source, indicating a **brute-force** password guessing attack.

The attack originated from **192.168.18.20** and targeted the parrot user account on the Linux endpoint **ParrotOS_Linux (192.168.18.63)**. The Wazuh SIEM recorded repeated **"Failed password"** events, which were decoded by the Wazuh SSH decoder and correlated by custom **Rule 100101**.

The alert is mapped to the MITRE ATT&CK framework under **Credential Access (T1110.001 - Password Guessing)**. During analysis, no successful authentication was observed. The activity was confirmed to be part of an authorized security lab performed to validate Wazuh's brute-force detection capability.

Entities Involved

Agent Name: ParrotOS_Linux

Target IP: 192.168.18.63

Source IP: 192.168.18.20

Target User: parrot

Rule Description: SSH Brute Force Attack Detected (5 failed logins from same IP within 60 seconds)

Alert Timestamp: 2026-07-01T18:02:51.105+0000

Action Items

- Verify the source IP address (192.168.18.20) belongs to an authorized user or internal security testing system.
- Confirm that no successful SSH login occurred following the failed authentication attempts.
- Review SSH authentication logs for additional suspicious activity before or after the alert.
- If the activity is unauthorized, temporarily block the source IP using firewall or active response mechanisms and investigate the source system.
- Ensure strong password policies, account lockout mechanisms, and SSH hardening controls are implemented to reduce the risk of brute-force attacks.
