

Incident Report

Alert Title: Host-Based Anomaly Detection Event (Rootcheck)

Alert Time: 24 hours and last 30 days

Priority: Medium

Rule ID: 510

Rule.level: 7

Verdict: False Positive

Summary

Wazuh Rootcheck generated an alert indicating that the system binary `/usr/bin/md5sum` matched a generic signature commonly associated with *trojanized Linux binaries*. The detection was based on Rootcheck's heuristic signature matching rather than a verified hash comparison or malware signature. The alert identified strings typically *found in shell-related functionality*, such as references to `/bin/sh`, `/dev/`, and other common system components.

The affected file is *part of the standard Linux coreutils* package and is responsible for generating MD5 hashes. Modern legitimate binaries frequently contain these strings as *part of normal functionality*, which can *cause Rootcheck's generic signatures* to generate false positives. No additional indicators of compromise, such as unauthorized *file modifications, suspicious processes, privilege escalation, or persistence mechanisms*, were observed in correlation with this event. Based on the available evidence, the alert is *assessed as a false positive*.

Entities Involved

Agent Name: wazuh-server

Rule.Description: Host-based anomaly detection event (Rootcheck)

Affected File: `/usr/bin/md5sum`

IP: 192.168.18.121

Action Items

Verify that `/usr/bin/md5sum` belongs to the official Linux coreutils package. Validate the file integrity using package verification tools and compare its cryptographic hash against the vendor-provided version. Review file ownership, permissions, and recent modification history to ensure the binary has not been replaced or tampered with. Correlate this alert with other security events, including privilege escalation, persistence, or malware detections. If integrity verification confirms the binary is legitimate, document the event as a false positive and consider tuning the Rootcheck rule to reduce recurring
